

UNIQUE SAFETY FEATURES

We at Allegheny recognize the importance of safety for your operators and your business. For this reason, the following safety features are standard on all Allegheny conveyor-fed shredders and related equipment.

- International symbol-coded safety labels that meet or exceed the guidelines set forth by the Product Safety and Label System established by the FMC Corporation. Each label is securely affixed where required on the machine. Allegheny uses both internal and external safety labels to ensure operator safety awareness.
- Key-locked, low voltage control panels to ensure safe operation by authorized personnel only. Control buttons are color-coded for stop, forward, and reverse operations.
- Two-position stop buttons to prevent accidental start-ups that can occur with single-position stop buttons. Once a stop button on any Allegheny machine is depressed, the equipment cannot be started again until the same stop button is manually pulled out.
- U.L. listed electrical components installed according to the National Electrical Code established by the National Fire Protection Agency.
- A fixed safety shield installed over the input conveyor just in front of the cutting assembly to prevent operators from reaching into the cutters.

All Allegheny machine covers are securely fastened to help prevent injury to operators and maintenance personnel – unlike lift-off panels, which can be dangerous because they allow easy access to internal moving parts (drive belt, gears, chains, etc.)

Allegheny includes a comprehensive owner's manual including preventative maintenance schedules with each machine to ensure safe, efficient operation and proper maintenance of the equipment.

REMEMBER - SAFETY FIRST!
